

FindOutTableExists

(Q) How do I find out from code if a table exists or not?

tags:
[HowTo](#)

(R) Pass the table name to the following function. Function will return True if table exists or False otherwise.

```
Function bTableExists(ByVal sTableName As String) As Boolean
' sTableName is not case sensitive

Dim i As Integer, oDefs As Object
    bTableExists = False
    Set oDefs = Application.CurrentDb.TableDefs
    For i = 0 To oDefs.Count - 1
        If UCase(oDefs.Item(i).Name) = UCase(sTableName) Then
            bTableExists = True
            Exit For
        End If
    Next i
End Function
```
